

# Advanced AlgoFlex

*Best practices  
and  
Tips & tricks*

Esben Skovenborg  
MUSIC, December 2016

- You already know the **basics**:
  - AlgoFlex client and server
    - Commands and data via TCP-based protocol
  - Block instances on the AlgoFlex server
    - "Audio" connections for synchronous data
    - "Parameter" connections for event-based data
  - Special blocks handle audio- and file-I/O
  - Running real-time vs "batch" simulations
  - Installation, SVN
  - etc.!
- ... so now let's dive into some advanced features

# The AlgoFlex Manual

TC Group | Research

Last updated: 2009-05-05

- Writing a new block
  - When (not) to declare individual **parameter callbacks**
    - *RegisterDataParm("MyParm", &parmPtr, &parmUpdate)*
  - Parameter **dependency**
    - *RegisterCallbackDependency(&A, &B)*

- AlgoFlex Manual, Ch. 3:  
**Block Author's Guide**

<b>3</b>	<b>BLOCK-AUTHOR'S GUIDE</b>
<b>3.1</b>	<b>CREATING A NEW ALGOFLEX BLOCK</b>
<b>3.2</b>	<b>CALLING-SEQUENCE OF ALGOBASE METHODS</b>
<b>3.3</b>	<b>BLOCK I/O-DIMENSION</b>
<b>3.4</b>	<b>PARAMETERS</b>
<b>3.5</b>	<b>SAMPLE-RATE</b>
<b>3.6</b>	<b>PARAMETER- AND SAMPLERATE-DEPENDENCY</b>
<b>3.7</b>	<b>COEFFICIENT-PROBES</b>
<b>3.8</b>	<b>GLIDERS</b>
<b>3.9</b>	<b>THE REAL-TIME CODE</b>
<b>3.10</b>	<b>SYNCHRONISATION</b>
<b>3.11</b>	<b>MEMORY MANAGEMENT</b>
<b>3.12</b>	<b>FREQUENCY-DOMAIN SIGNAL PROCESSING</b>
<b>3.13</b>	<b>DESIGNING FOR REUSABILITY</b>
<b>3.14</b>	<b>API DOCUMENTATION AND BLOCK HELP</b>
<b>3.15</b>	<b>PLATFORM-NEUTRAL CODING</b>

- Writing a new block (cont'd)
  - **AFData** container objects
    - Every AFData object has a *type* and a *dimension*
    - Similar to MATLAB
      - vector, matrix, string, and cell array
    - An AFData matrix can be indexed (without conversion to C array)
      - *myMatrix->GetAt<double>(x,y)*
    - Ref: Manual ch. 7.4, 7.5

- Writing a new block (cont'd)
  - **AFGliders** and coefficients
    - Gain and GainMatrix blocks as examples
    - Just use *AFGlider* instead of *double*
    - A glider's properties can be adjusted - even on runtime:
      - `AlgoFlexClient(srv,'SetData','MyGain','GLD_GainFactor',{'Linear','3','1e-6'})`
    - Ref: Manual ch. 3.8

- Friendly documentation of the **main classes**:
  - AlgoBase, AFData, AFGlider, ...
  - Ref: [AlgoFlex/doc/doxygen/html/index.html](http://AlgoFlex/doc/doxygen/html/index.html)

## AFData Class Reference

**AFData** is the AlgoFlex data-container class. [More...](#)

```
#include <AFData.h>
```

[List of all members.](#)

### Public Types

```
typedef vector< size_t > DimsType
A typedef for convenience and forward-compatibility.
```

### Public Member Functions

<b>AFData</b> ()	<i>Construct an empty object (of type AF_REAL).</i>
<b>AFData</b> (const <b>DimsType</b> &dims, <b>AF_DATA_TYPE</b> type)	<i>The most general constructor.</i>
<b>AFData</b> (const <b>AFData</b> &obj)	<i>Copy constructor.</i>
<b>AFData</b> (size_t length, <b>AF_DATA_TYPE</b> type)	<i>Short cut for constructing an object containing a vector.</i>
<b>AFData</b> (double x)	<i>Short cut for constructing an object containing only a real scalar.</i>
<b>AFData</b> (const string &str)	<i>Short cut for constructing an object containing only a string; the data is copied.</i>

- **Scheduling of blocks** in an algorithm
  - Execution-sequence
    - scheduling order of block instances
    - DetermineExeOrder server command
      - *automatic* optimal exe-sequence (experimental)
  - Up- and down-sampled block rates
    - relative to "base rate" fs
  - *The blocks themselves don't decide (but can ask on runtime)*
  - Ref: Manual ch. 2.6

- Generating a **block diagram**

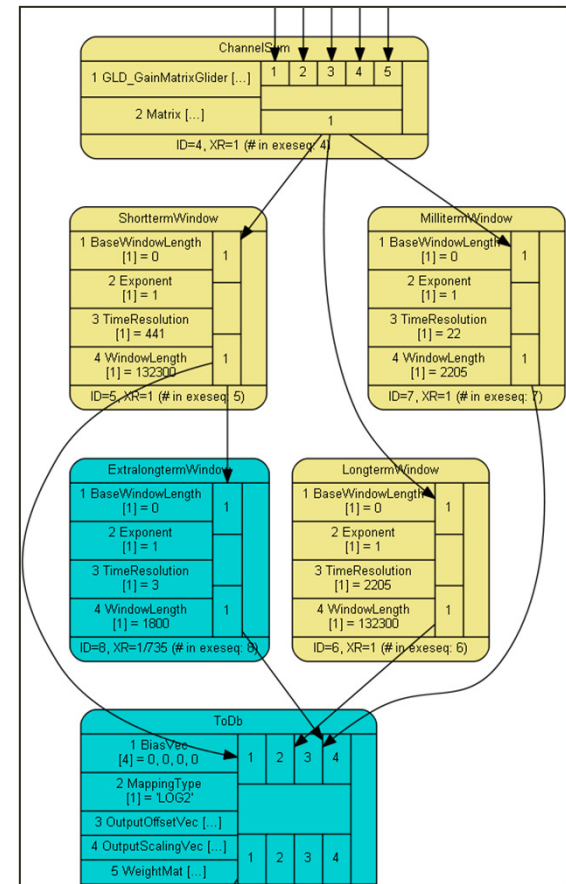

- Server command:

- GenerateGraph(shortcuts, hiddenblocks, what, size, format, filename)*

- ... so from Matlab:

- AlgoFlexClient(srvId,'GenerateGraph',{},{},  
'Audio+Parms',50,'svg','C:\tmp\MyDiagram')*

- Ref: Manual ch. 7.11

- **XML diagrams**

- Saving and loading an algorithm
  - not necessarily an entire effect
- Block instances and routing
  - *Myalgo.diag.xml*
- Partial presets
  - *Myalgo-1.parm.xml*
  - *Myalgo-2.parm.xml*
  - ...
- Use case:
  - a **complete** and **unambiguous** definition of an algorithm
  - suitable for revision control
    - but not for heavy editing
- Ref: Manual ch. 6

- **Vector and file processing**

- *AlgoFlexEvals.m*

- Simulating one AlgoFlex block as a MATLAB function
    - Ref: help AlgoFlexEvals

- *AlgoFlexEval.m*

- Simulating a **chain** of AlgoFlex blocks...
    - Ref: help AlgoFlexEval

- **Audio file** processing

- when your signal doesn't fit into RAM
      - *input file -> block chain -> output file*
    - Ref: help AFProcessFile

- Starting a **new server** (process)
  - *NewAFServer.m*
    - release/debug mode?
    - killing of already running servers?
    - minimised console window?
    - Ref: help NewAFServer
  - Multiple simultaneous servers - no problem
    - only the server ID is needed, after connecting
- For **distributed processing** -
  - start servers and connect manually
  - stream data between servers on LAN
    - TCPSource/TCPDestination blocks
  - Master/Slave server mode (*experimental*)

- **AlgoFlex clients**
  - Matlab (and Octave)
    - Java module handles network and protocol
    - Ref: AlgoFlex/Client/\*
  - C++
    - Ref: MABUH
  - JavaScript
    - Ref: SILYN
  - AFGUI
    - (see other slide)
  - Server Command Files
    - **client-less** server scripts
    - Ref: Manuel ch. 7.14

- **Client-side callbacks**

- Matlab's single-threaded event loop:
  - *while !quit*  
    *receive command*  
    *interpret command*
- Callbacks from server to:
  - Matlab .m file
  - Java object
- Great for meters and GUI updates
  - any AFData object
- Ref: AlgoFlex\Client\DemoScripts\ClientCallback

- **Audio I/O blocks**
  - AsioStream vs AudioStream block
  - *AudiolOWiz.m*
    - making prototypes independent of *your* soundcard
  - DummySync block
  - TCPSource + TCPDestination = network streaming
    - Ref: Mabuh, Silyn
  - Linux and Jack
    - Ref: Andreas

- **External controllers and meters**

- MIDI

- **MidiControl** block

- ... a wrapper around *RtMidi* library

- Maps midi CC messages to/from AlgoFlex parameters in real-time

- OSC (Open Sound Control)

- "a better midi" – network-based, typed, fast, hierarchical

- **OpenSoundControl** block (*proof-of-concept*)

- ... a wrapper around *oscpack* library

- iOS / Android apps

- **AlgoFlex Testing Framework**
  - Automatic regression tests
    - "unit tests" per block
  - The magic starts with -
    - MyBlock\TESTCASES.m
    - *for example:* lirFilter\TESTCASES.m
  - Ref: help RunTests

```
function TEST = TESTCASES()
% Define one or more test cases, using the AlgoFlex Testing Framework.

%% DEFINE TEST 1

[b,a] = butter(4, 0.1); % a 4th order lowpass digital Butterworth filter
sos = tf2sos(b,a); % convert to second-order sections

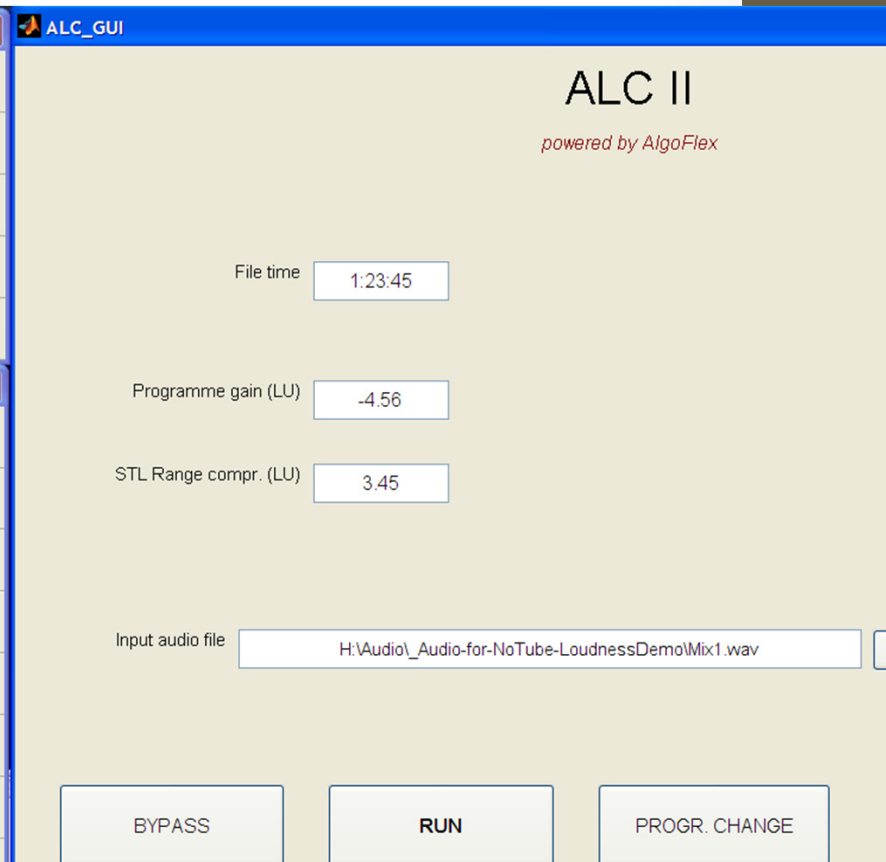

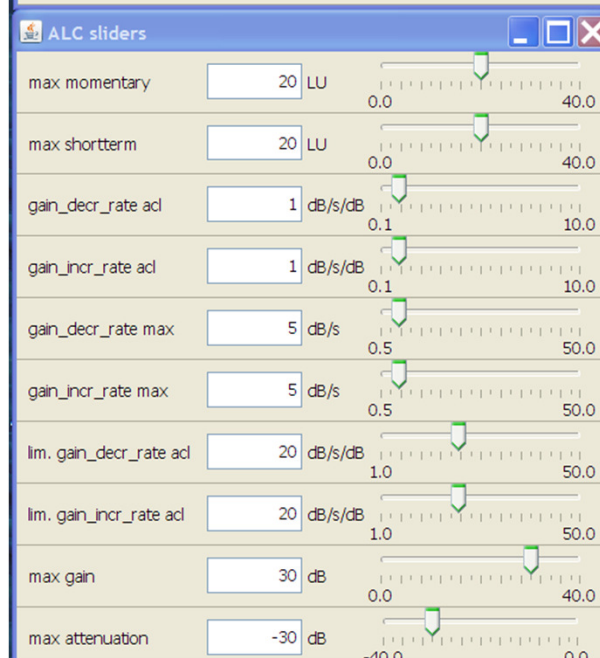

TEST(1).name = 'IIR filter simple';
TEST(1).parms = {sos,1,{}};
TEST(1).process = @(test_parms) process(test_parms{:});
TEST(1).reference = @(test_parms) reference(test_parms{:});
TEST(1).verify = @(y,y_ref,test_parms) verify(y,y_ref,test_parms{:});

%% DEFINE TEST 2

[b,a] = butter(6, 0.1); sos3(:,1) = tf2sos(b,a);
[b,a] = butter(6, 0.2); sos3(:,2) = tf2sos(b,a);
[b,a] = butter(6, 0.3); sos3(:,3) = tf2sos(b,a);
TEST(2).name = 'IIR filter multi-channel, individual coefficients';
TEST(2).parms = {sos3,3,{}};
% Reuse process() and verify() functions from TEST(1), above.
```

- **GUI** for rapid prototyping
  - AFComponents
    - Ref: Manual ch. 5
  - Java sliders and meters from Matlab
    - AlgoFlex/Client/
      - create\_af\_meter.m, create\_af\_slider.m
      - make\_scalable\_gui.m, make\_simple\_gui.m
    - Client\DemoScripts\AFComponents
  - **AFGUI** application (aka. Auto GUI, aka. DUIG)
    - Status: maintenance required
    - Ref: Manual ch. 4

- *AFComponents*  
*in action:*

- *AFGUI*  
*in action:*

The screenshot displays the AFGUI (Audio File GUI) interface, which is used for controlling audio processing blocks. The interface is divided into several sections:

- Views:** Includes buttons for Connection, File, XML, Console, Inspector, and Refresh.
- Connection:** Shows the Address (localhost) and Port (4242) fields, along with a Disconnect button. The status is "Ready..."
- DUIG (Data User Interface):**
  - Left Panel:** A tree view showing the hierarchy of blocks: AlgoFlex Server, TP Blocks, MyFilePlayer, non TP Blocks, AudioIO, MyGain, GLD\_GainFactor, GainDb, Master Blocks, and Perspectives.
  - Right Panel:** Displays the GainDb block with a value of -3.771 dB. A slider control is visible, ranging from -12.0 to 12.0 dB.
- Execution:**
  - Execution Sequence:** Lists the blocks being executed: AudioIO, MyFilePlayer, and MyGain.
  - Sample Rate:** Set to 44100 Hz.
  - Process Commands:** Includes a field for the number of seconds and buttons for Start, Stop, and Destroy All.

A detailed view of the **MyGain:GainDb** block is shown in a separate window, displaying its properties:

Property	Value
DataType	2.0
Default	0.0
Max	120.0
Min	-120.0
Scale	lin
Unit	dB
ui_visible	1.0
ui_component	AFSlider
ui_name	GainDb
ui_callbacks	0
ui_min	-12.0
ui_max	12.0
ui_stepsize	2.4
ui_jumpsize	24.0
ui_precision	3.0
ui_tics	10.0

- **Chunk-based processing**
  - in an AlgoFlex server
    - AlgoFlex\Client\DemoScripts\FilterTestScript\_chunkproc.m
    - basically:
      - *AlgoFlexClient(srv,'SetSystemParameter','ProcessingMethod','Chunked')*
      - *AlgoFlexClient(srv,'SetSystemParameter','ChunkSize',64)*
      - before block instantiation
  - in an *AlgoLib* project
    - (other slide)
  - Algo feedback and latency considerations
  - Ref: Manuel ch. 7.10

- **AlgoLib code-generation**
  - a.k.a. Native Processing Framework
    - auto-generating C++ code for an algorithm by inling and glueing the blocks together
    - Result: a link library with a generic C++ interface
  - *Basically works, but some rough edges*
    - *used in several plug-in products*
  - AlgoFlex\NativeAlgorithmFramework\\*
    - class AFAlgorithmManager
    - class AFAlgorithmInterface
  - Ref: Manuel ch. 7.9

- **Metablock** feature
  - Handle a sub-algorithm as a separate block
  - ... with routed internal connections
  - ... with internal execution-sequence and -rates
  - ... with selected external parameters
  - **Hierarchical** algorithm development
  - Use to separate *implementation* from *application*
    - in block diagrams
    - in XML or CreateAlgo.m scripts
  - More effective **reuse** of higher-level structures
  - Status: Not yet in SVN trunk (90% done)

- AlgoFlex is -
  - Rapid prototyping
  - Reference implementations
  - *A different tool for different users*
- "In-house open source software"
  - community support
  - patches welcome 😊
  - Collaboration tools:
    - SVN (Git?)
    - TestTrack (Jira?)
    - Twiki (Confluence??)
    - AlgoFlex-users@tcelectronic.com???
    - *coordination of future development...?*

*TIME FOR QUESTIONS?*
